

LOUDSPEAKER CABLE OF THE YEAR Synergistic Research Foundation

“Consistency in this case means cables both perform equally well and deliver a well balanced sound that is coherent and precise from the lowest notes to the highest.”

Synergistic Research's Foundation Series cables uses 6N purity pure silver conductors using Synergistic's own handmade Air String geometry with the company's UEF (Uniform Energy Field) Matrix shielding in a grid pattern inside the cable and with a graphene sleeve extending around the connector itself. The loudspeaker physically separate the positive and negative, with two distinct conductors for each speaker terminal connection... but they are thin and flexible enough to be unobtrusive, and they come in a choice of black or white too.

Best used as part of a complete Foundation cable system, in our test, Alan Sircom suggested that, "Consistency and detail are uppermost with Synergistic's Foundation cables. They are remarkably revealing, both of equipment, but in particular of the music played through that equipment. Consistency in this case means cables both perform equally well and deliver a well-balanced sound that is coherent and precise from the lowest notes to the highest." He concluded that, "Synergistic Research has taken the technologies used in its top cables and trickled down to an affordable level without sacrifice. Foundation is an excellent, er, bedrock in audio that can make a potentially good system into a really great one." +
